OWL System Overview

Components

OWL consists of two main entities: the compute system and the storage system. They are more or less independent of each other and are also physically separate.

HPC System

The HPC part is made up of several compute nodes, a master node and 2 login nodes.

Storage System

The storage part consists of two storage and two metadata servers with several virtual configured volumes and a parallel file system (BeeGFS) plus (read-only) access to the “old” GPFS file system of the former KEA system.

Access

Login

Everyone with an IFU computer account can login into OWL using one of the login nodes (**owl01amd**, **owl02intel**). The users' home directories are located in `/bg/home`, projects are located in `/bg/data`.

For Windows systems, [MobaXterm](#) is recommended. Also [putty](#) can be used but it has no graphical forwarding. Likewise the internal ssh of the windows powershell is suitable.

Access to compute nodes

The compute nodes can only be accessed through the **SLURM** scheduling system. To be able to work with SLURM users need to have an account. To get one, send me a PM in Mattermost (b.fersch) or email to fersch@kit.edu or come to my office.

Access to file storage

Initially, users will get a 100 GB quatum on the BeeGFS system. This can be increased to several TB but good reasons are required... for requests: PM to me in Mattermost (b.fersch) or email to fersch@kit.edu or step by my office.

Access to S3 storage There is also a S3 cloud object storage available

at IFU. Ask Frank Neidl or Christof Lorenz for details if you would like to make use of it.
